

1. One end of a 30-cm long aluminium rod is exposed to a temperature of 500°F while the other end is maintained at 20°F . The rod has the diameter of 2.5 cm. If heat is conducted through the rod at the rate of 164.9J/s, calculate the thermal conductivity of aluminium of the aluminium rod.

209.9 W/m $^{\circ}\text{C}$

2. The heat from the sun travels to the earth through the process of:

radiation

3. A young scientist tries to obtain the parameters of a satellite orbit using the method of dimensional analysis and obtained the formula $Q = gR_e^2 R_c^{\frac{1}{2}}$, where the orbital radius is R_c , radius of the earth is R_e and acceleration due to gravity is g . What does Q represents.

Orbital speed of the satellite

4. Calculate the temperature at which the root-mean-square speed of oxygen molecules will have the value of 640 m/s. [1 kilomole of oxygen has a mass of 32kg].

252.5°F

5. 4000 J

6. An object of mass 200 g oscillates horizontally without friction at the end of a horizontal spring for which $k=7.0\text{ N/m}$. The mass is stretched 5.0 cm from equilibrium and released. Find its maximum speed.

0.30 m/s

7. $T_1=20^{\circ}\text{N}$ and $T_2=203^{\circ}\text{N}$

8. The fundamental force in nature which accounts for the existence of bulk matter is:

electromagnetic interaction

9. 25 J

10. Which of the following physical principles explains why curved shape of an aerofoil or the wings of an aircraft creates a faster flow of air over its top surface than the lower surface?

Bernoulli's principle
