

Biological instructions are encoded in the DNA

The principal genetic information materials or molecules of living organisms are chemically called nucleic acid

The enzymes which link up the nucleotides by bonding the phosphate group of nucleotide to the sugar molecule of the adjacent nucleotide during replication is the DNA Polymerase

The units of inheritance that transmit information from parents to offspring to ensure continuity of life is the gene

Breakage of a chromosome can lead to four types of changes in chromosome structure; these are deletion, duplication, inversion, translocation

Molecular cloning allows individual DNA fragments to be propagated in bacteria and isolated in large amounts

A gel that is used in electrophoresis is usually made from agarose or polyacrylamide

All are techniques in molecular biology except Gram stain

A good examples of nucleic acids are; DNA and RNA

One of the following is correct about translation  
It involves a change of code from nucleotide sequences to amino acid sequences
