

The ----- allows classification of cells into two major groups.  
electron microscope

The passive transport across membrane does not take place through  
simple diffusion

The glycosidic linkage found in trehalose is  
(1-1)

Drug metabolism and detoxification takes place in the  
endoplasmic reticulum

The D and L isomerism is determined by the configuration on  
the anomeric carbon

The product of reduction of galactose is  
Dulcitol

The lipoprotein implicated in peripheral vascular disease is  
LDL

Which of the following is not an example of phospholipids  
Cerebroside

The following metabolic pathway occurs in the mitochondria except  
glycogenesis

Free radicals are destroyed in the  
Peroxisome
